Executive Summary July 7, 2017

1.0 EXECUTIVE SUMMARY

Stantec Consulting Services Inc. (Stantec) was retained to complete a traffic impact study for the proposed 1849 Park, to be located along Cameron Road between Pecan Street and Fuchs Grove Road in Pflugerville, Texas. The development will be constructed in two phases but is expected to be fully developed by 2030. Considering background growth and future roadway infrastructure, the study intersections are expected to operate at a reasonable level of service. Based on the sight distance analysis under existing conditions for Cameron Road at the proposed southeast driveway, the sight distance is adequate for the Phase 1 driveway.

To allow the best progression in and around the development, the following items are recommended:

• The existing vertical curve between the future intersection of Cameron Road and Melber Road could cause sight distance issues and should be evaluated during the design of Melber Road.

Intersection	Approach	2030 Build Condition 95 th Percentile Queue (ft)	City Minimum Left Turn Storage Length (ft)	Proposed Storage Length (ft)
Cameron Rd & Melber Rd	EB-L	40	100	100
	EB-L	20	100	100
Cameron Rd & SE Driveway	WB-R		100	100
	SB-L	20	100	100
Melber Rd & SW Driveway	WB-R		100	100
	SB-L	20	100	150
Melber Rd & Mid Driveway	WB-L/R	20	100	100
	NB-L	20	100	100
	NB-R	-		100
Melber Rd & NW/NE Driveways	SB-L	20	100	100
	WB-L/R	60	100	150

• The storage lengths in the table below should be provided for the study intersection. The analysis assumed a 12-foot lane width.

Introduction July 7, 2017

2.0 INTRODUCTION

Stantec Consulting Inc. (Stantec) was retained to complete a traffic impact study for the proposed 1849 Park site, to be located along Cameron Road between Pecan Street and Fuchs Grove Road in Pflugerville, TX. At its full build-out estimated for the year 2030, the site is expected to contain the following:

- eleven multi-purpose fields for football/soccer/lacrosse/etc.
- six baseball/softball fields
- eight tennis courts
- two basketball courts
- eight sand volleyball courts
- a dog park (5 acres)
- a destination playground and splash pad (1 acre)
- areas for open play and festivals
- a 2,000-seat amphitheater
- a wildflower and prairie preserve

In addition to normal park usage, the site is expected to host the annual Deutschen Pfest festival and other similar special events. The festival, typically in mid-May, currently sees around 10-12,000 visitors over three days, from Friday through Sunday. This report includes a study of the estimated traffic operations related to special even traffic and general peak of the recreational fields.

The site driveways will be linked by internal roadways, and will have a total of five connections onto Cameron Road and the future Melber Road. The location of the proposed site is shown in **Figure 1**. A scaled-down version of the site plan is shown in **Figure 2**, with the full-sized plan provided in **Appendix A**.

Introduction July 7, 2017

Figure 1 Proposed Site Location

Figure 2 Proposed Site Plan

Data Collection and Existing Conditions July 7, 2017

3.0 DATA COLLECTION AND EXISTING CONDITIONS

For this study, turning movement counts were collected at intersections near the proposed sites as part of another project. A site visit was made to the study area to document traffic operations, geometric characteristics, and sight distances.

3.1 TRAFFIC COUNTS

For this study, traffic counts provided by the City for the intersections of Cameron Road at Pecan Street and Cameron Road at Fuchs Grove Road were collected on Wednesday, August 5, 2015. Local schools were not in session during this date. These turning movement counts were used to estimate volumes along Cameron Road at the proposed site. The counts were collected during a weekday during an AM peak hour of 7:00-9:00AM and a PM peak hour of 4:00-6:00PM. A factor was applied to convert these counts to an estimated Saturday peak hour volumes based on 24-hour weekday and Saturday volumes collected on other projects.

All count data received from the City is provided in Appendix B.

3.2 SITE VISIT

A site visit was conducted by Stantec staff on Friday, January 6, 2017. During the site visit, geometric conditions at each study intersection were noted. In addition, general traffic operation conditions were observed.

The site visit allowed engineers to review topography for a better understanding of the sight distance. Cameron Road is expected to become a 6-lane roadway by the time this park is full built-out and the roadway project will smooth the current sharp curves in the roadway.

At the time of the site visit, dirt work was underway for Phase 1 of the proposed park. This allowed the engineer to see the planned location of the southeast driveway onto Cameron Road.

Data Collection and Existing Conditions July 7, 2017

3.3 EXISTING AND FUTURE ROADWAY DESCRIPTIONS

Cameron Road is a two-lane, undivided major arterial, as classified in the Pflugerville Master Thoroughfare Plan. At the proposed site, the posted speed limit is 55 mph, however an s-curve near the southwest corner of the future site has a recommended speed of 45 mph.

In the City of Pflugerville Master Transportation Plan, Cameron Road is expected to be widened to a six-lane roadway by the year 2035. The s-curve adjacent to the proposed site is also expected to be smoothed in order to avoid the need for a lower recommended speed.

Melber Road is included in the City of Pflugerville Master Transportation Plan to be a 4 to 5-lane roadway by the year 2035. It is expected to run north/south, from Cameron Road to Rowe Lane. The roadway would provide access to four of the five driveways of the proposed site.

For purposes of this study, it will be assumed that the improvements to Cameron Road and the new construction of Melber Road will be completed by the year 2030, the estimated full build-out year of the proposed site.

Future Background Traffic Forecasts July 7, 2017

4.0 FUTURE BACKGROUND TRAFFIC FORECASTS

Background traffic growth was estimated by using average daily traffic figures from TxDOT's Transportation Planning Maps. Historical average daily traffic (ADT) were observed from 2012 to 2015 in the area around the proposed site and grown to the build year 2030. The build year of 2030 was selected based on when the park will be fully constructed.

The historical ADT volumes near the project site showed a yearly growth rate of 15%. This growth rate, however, is not expected to sustain until the build year; therefore, a long-term growth rate of 5% was also used. The growth rates were applied as follows:

- 15% growth from 2015 to 2020
- 5% growth from 2020 to 2030

No background developments were indicated to be included in this study; therefore, only the grown counts were considered for the background future traffic forecast.

Projected Site Traffic July 7, 2017

5.0 **PROJECTED SITE TRAFFIC**

The traffic generated by the proposed sites was estimated through trip generation and trip distribution analyses. The turning movement volumes at each of the proposed site's driveways and the intersection of Cameron Road and Melber Road will be presented as the result of this analysis.

5.1 **PROJECT SITE TRIP GENERATION**

The standard practice for estimating site trip generation is to use the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*, 9th Edition. Data previously collected at some parks in Texas was also utilized to estimate the trip generation for those development components that do not fit into standard ITE Trip Generation land use categories.

For the park's general use, the following sources were used to estimate trip generation figures:

- <u>Sport Fields</u>: Using ITE trip generation estimates for the land use "Soccer Complex" (Code 488), the volumes were deemed to be unrealistically low. As a more conservative estimate, data collected at another soccer field in McKinney, Texas was utilized. The data showed PM peak hour trips were 93% higher than the ITE rates and Saturday trips were 3% higher than ITE rates.
- <u>Dog Park</u> and <u>General Park Land</u>: Engineering judgement was used, as ITE did not provide useable figures for these land uses.
- <u>Tennis/Basketball/Volleyball Courts</u>: ITE estimates for the land use "Tennis Courts" (Code 490) were used for all courts, as ITE does not provide estimates for basketball and volleyball courts. To account for higher per-court usage for basketball and volleyball courts, their trip generation rates were adjusted: a basketball court was assumed to attract as many trips as three tennis courts; a volleyball court was assumed to attract as many as two tennis courts.
- <u>Playground/Splash Pad</u>: Trip generation rates were based upon data collected at two parks in the Dallas region that included 8,500-9,000 SF of play structures and included splash pad areas.

Pflugerville's annual Deutschen Pfest festival is also expected to use the proposed site and the event was used to analyze a possible special event traffic scenario. The festival demand of around 10,000-12,000 visitors over three days (Friday – Sunday). Engineering judgement was used to estimate a peak day of 5,500 visitors to the festival; from there, a peak period was estimated to generate 20% (1,100 trips) of the total trips for that peak day. The peak ingress and egress time is expected to be on a Saturday.

Trip generation for the proposed site's general use was conducted for a Saturday peak hour, which is typically the highest peak hour usage for a park. General park use and the festival are expected to not occur simultaneously, and their trip generation estimates were not combined.

Projected Site Traffic July 7, 2017

The trip generation estimates for general park use are shown in **Table 1**; the trip generation estimate for the festival is shown in **Table 2**.

	Saturday Peak				
Land Use	Total Peak Hour Trips	In	Out		
Sport Fields (17 total fields)	533	235	298		
Dog Park (5 acres)	100	50	50		
Tennis/Basketball/Volleyball Courts (18 total courts)	101	51	50		
Playground/Splash Pad (1 acre)	100	50	50		
General Park Land	80	60	60		
Total	954	446	508		

Table 2 Proposed Site Trip Generation (2030) — Special Event

		Festival Peak		
	Total Daily Trips	Total Peak Trips	In	Out
Deutschen Pfest Festival	5500	1100	528	572

5.2 TRIP DISTRIBUTION & ASSIGNMENT

A trip distribution analysis is used to estimate how site-generated trips enter and exit the project's study area. For this study, the external trip distribution was based on the 2035 volume counts stated in the City of Pflugerville Master Transportation Plan (2013) to account for future development in the area toward the year 2030. The trip distribution assumptions are shown in **Figure 3**. The trip distribution percentages were assumed to be the same for inbound and outbound traffic.

Projected Site Traffic July 7, 2017

Figure 3 Proposed Site Trip Distribution (2030)

5.3 SITE TRAFFIC VOLUMES

The resulting site trips for each intersection within the study area based on the trip generation, distribution and assignment analyses are shown in **Figure 4** for general park use, and **Figure 5** for the Special Event traffic. The site traffic volumes assume that no improvements would be made within the study area.

Projected Site Traffic July 7, 2017

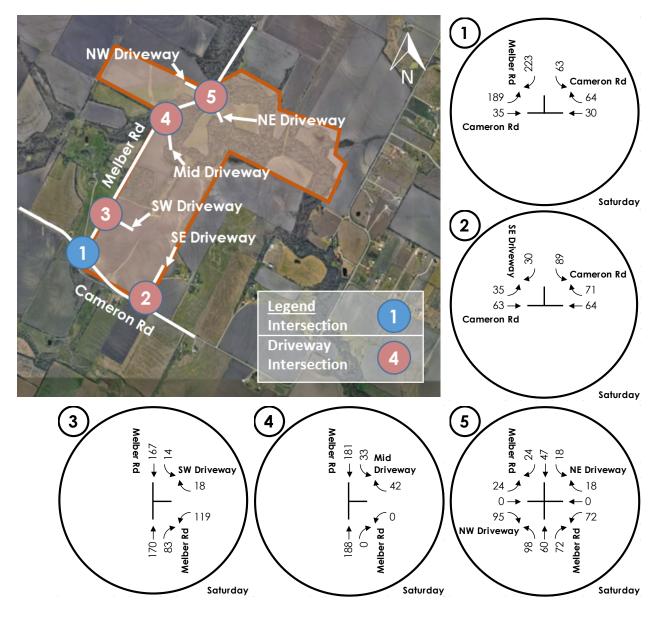

Figure 4 Project Site Traffic Saturday Volumes (2030) — General Park Use

Projected Site Traffic July 7, 2017

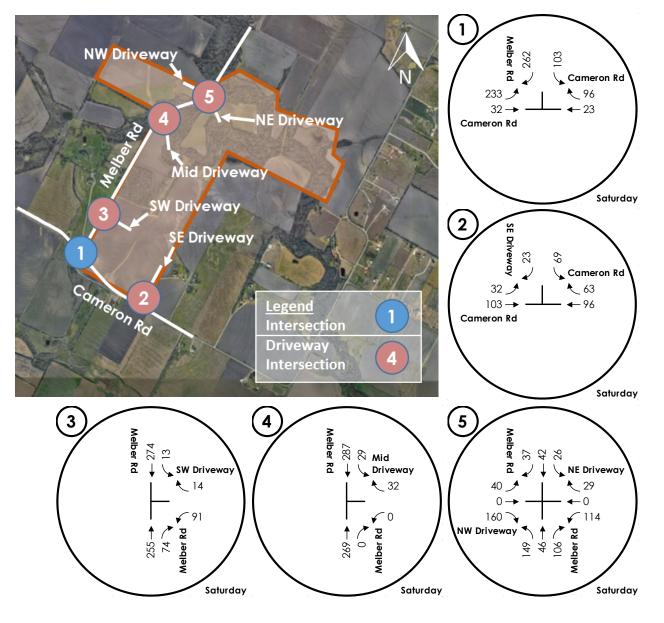

Figure 5 Project Site Traffic Volumes (2030) — Special Event

Traffic Analysis July 7, 2017

6.0 TRAFFIC ANALYSIS

6.1 METHODOLOGY

Synchro[™] Version 9 was used to perform capacity analysis at each intersection. The capacity analysis functions in Synchro are based on the Transportation Research Board's *Highway Capacity Manual* (HCM), Ed. 2010. The HCM is a nationally recognized standard for performing capacity analyses. The reports generated from each *Synchro* model are shown in **Appendix C**.

Capacity analyses are evaluated based on a level of service that ranges from A (excellent) to F (poor). Levels of service A through D are generally considered acceptable and levels of service E and F are considered unacceptable. The city of Pflugerville Engineering Design manual states that all signalized and all-way stop intersections shall operate at a level of service of 'D' or better with a volume to capacity (V/C) ratio of 0.95 or less. Other un-signalized intersections (including un-signalized private accesses) shall operate at level of service 'E' or better for major street left turns on side street approaches. A LOS of 'F' may be allowed if the movement has a relatively low V/C ratio and there are no known safety problems at the intersection. The level of service thresholds in the Highway Capacity Manual for signalized intersections and stop-controlled intersections are shown in **Table 3**.

	Control Delay Per Vehicle (seconds)				
LOS	Signalized Intersection	Stop-Controlled Intersection			
А	≤ 10	≤ 10			
В	>10 and ≤20	>10 and ≤15			
С	>20 and ≤35	>15 and ≤25			
D	>35 and ≤55	>25 and ≤35			
E	>55 and ≤80	>35 and ≤50			
F	> 80	> 50			

Table 3 Intersection Level of Service Thresholds

6.2 FUTURE BUILD CONDITION

The future build condition volumes are the sum of the estimated background traffic growth and the projected traffic generated by the project site. Analysis was done for the intersection of Cameron Road and Melber Road, and the four site driveways which intersect either Cameron Road or Melber Road. The estimated future build volumes for general park use during a Saturday peak hour are shown in **Figure 6**; the future build volumes for the special event are shown in **Figure 7**.

Traffic Analysis July 7, 2017

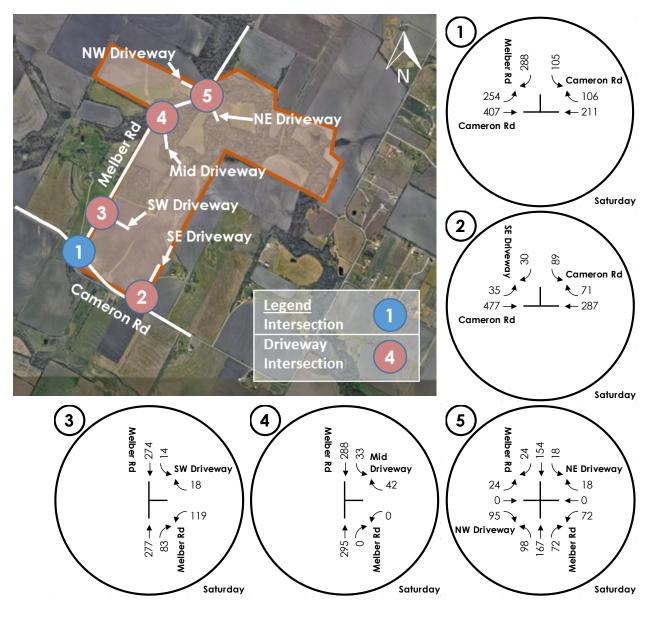

Figure 6 Future Build Saturday Volumes (2030) — General Park Use

Traffic Analysis July 7, 2017

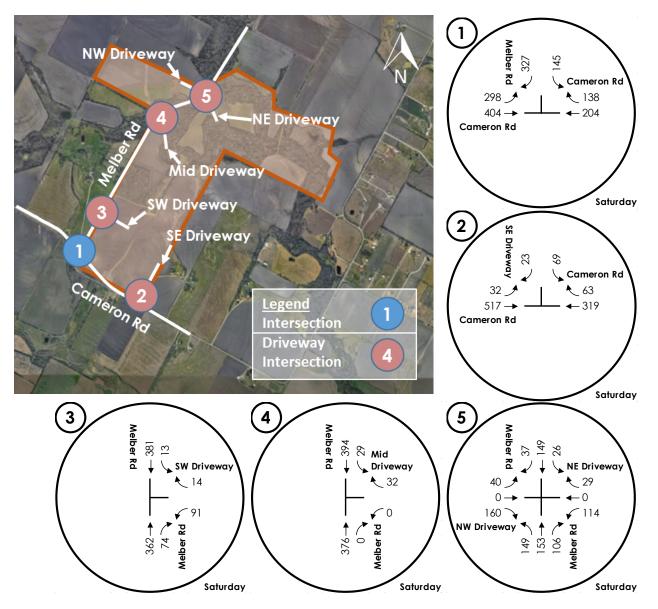

Figure 7 Future Build Volumes (2030) — Special Event

The results of the future build condition capacity analysis are shown in **Table 4**. For both general park use and special event use, the only movement expected to face a level of service lower than LOS D would be the southbound left turn movement at Cameron Road and Melber Road. The worst-case scenario would occur with general park use, with an estimated delay of 75 seconds and a 95th-percentile queue of around 5 vehicles. Because this delay is expected to occur only during the Saturday peak hour when all fields are in use (i.e. once per week), improvements to the intersection would not be deemed necessary at this point in time.

Traffic Analysis July 7, 2017

		Control			Level of Service (Delay [s])		
No.	Intersection	Type	Approach	General Park Use		Special Event	
		Type		Approach	Overall	Approach	Overall

5		' Ntop	EB	11 (B)		13 (B)	
	Driveways		WB	17 (C)		32 (D)	

Table 4 Future Build Condition Capacity Analysis (2030)

*Overall LOS not defined by HCM methods for side-street stop controlled intersections.

Festival and typical weeknight traffic operate similarly. In both scenarios, most movements operate at LOS D or better, except for the SB left turn at Cameron Rd and Melber Rd, which fails during both peak analysis hours. As noted in Tables 1 and 2 above, the project generates more traffic during a festival than during a typical Saturday. Therefore, delay was noted to be higher for each turning movement and approach during the festival.

Access Management July 7, 2017

7.0 ACCESS MANAGEMENT

For the proposed driveways along Cameron Road and Melber Road, a roadway analysis was done to determine whether additional lanes would be needed at each of the driveways within the proposed site. For the future driveway along Cameron Road, an intersection sight distance analysis was performed. Lastly, an auxiliary lane analysis was done to determine whether right-turn ingress and/or egress lanes (i.e. turn bays) would be required to meet TxDOT standards.

7.1 INTERNAL ROADWAY ANALYSIS

For the capacity analysis shown in **Table 4** on page 6.4, it was assumed that each of the site driveways would have one lane both to enter and exit the site. At the intersection of Melber Road and Cameron Road, separate left-turn and right-turn lanes were used on the southbound approach along Melber Road.

Based on the peak hour analysis, delays at each of the site driveways is expected to be low. An extra lane may be considered at each of the site driveway intersections to separate left turn and right turn movements out of the site; doing so would reduce delay for right-turn movements out of the site.

The Highway Capacity Manual provides planning level of service criteria based on a roadway's number of lanes and the presence of exclusive left-turn lanes. **Table 5** shows the level of service thresholds for directional volume assuming uninterrupted flow in an urban area. Based on these volume tables, all roadways within the park should be able to operate as 2-lane undivided roadways.

Peak Hour Direction	Peak Hour Directional Volumes — Urbanized Areas — Uninterrupted Flow Highways					
Туре	Exclusive Left- Turn Lane?	LOS B	LOS C	los d	LOS E	LOS F
1-Lane Undivided	No	420	840	1,190	1,640	>1,640
1-Lane Divided	Yes	441	882	1,250	1,722	>1,722
2-Lane Undivided	No	1,358	1,920	2,430	2,693	>2,693
2-Lane Undivided	Yes	1,720	2,432	3,078	3,411	>3,411
2-Lane Divided	Yes	1,810	2,560	3,240	3,590	>3,590

Table 5 Uninterrupted Roadway Level of Service

If an assumption was made that a third of the parking lot capacity on the southern side (2,325 spaces) entered or exited the parking lots over a 15-minute period, and two-thirds used the southwest driveway onto Melber Road, the equivalent peak hour demand would be 2,066 vehicles per hour. As shown in the table, a four-lane roadway (two lanes in each direction) would be needed to achieve an LOS D or better during this peak period.

Access Management July 7, 2017

In addition to providing adequate access during a peak intake or discharge of traffic, a four-lane median divided roadway would allow for flexible operation along the roadway; for example, a bus to shuttle people from the parking to the festival grounds could stop along the roadway to pick up passengers from the parking lot entrances and not block incoming vehicles. This four-lane roadway could be built from the southwest driveway along Melber Road to the roadway's intersection with the driveway leading to the southeast entrance of the site. **Figure 8** shows the recommended number of lanes throughout the proposed site.

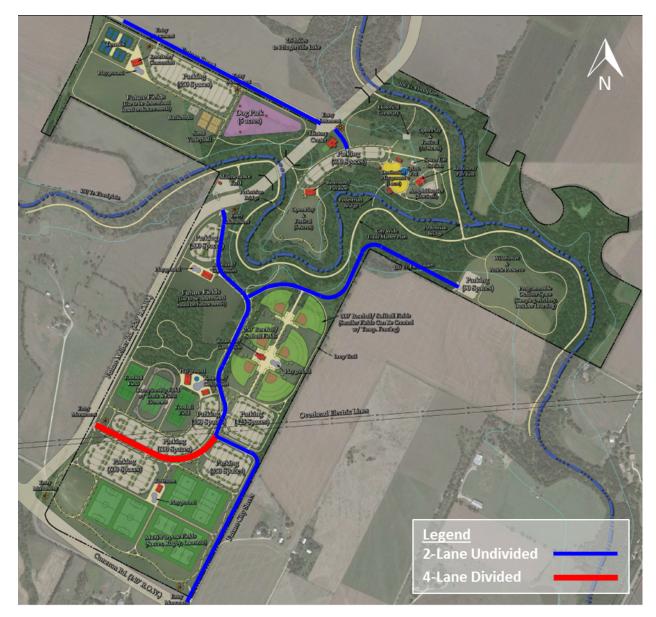

Figure 8 Internal Roadway Number of Lanes

Access Management July 7, 2017

7.2 INTERSECTION SIGHT DISTANCE

Required intersection sight distance is based on meeting the threshold for stopping sight distance for a given speed. Stopping sight distance is calculated as the sum of the "Brake Reaction Distance", or the distance traveled before beginning to brake, and the "Braking Distance", or the distance traveled while braking. AASHTO's A Policy on Geometric Design of Highways and Streets, Ed. 2011 calculates stopping sight distance based on studies in reaction time and deceleration while braking.

The results of the intersection sight distance analysis are shown in **Table 6**. Sight distance for the proposed intersection of Cameron Road and Melber Road was only reviewed to determine if there would be any future horizontal sight distance issues that would need to be addressed. However, the existing S-curve that causes limited horizontal sight distance in that area will be removed during the future roadway expansion. Sight distances noted in the table are based on current 2-lane roadway conditions and should be re-evaluated during the Cameron Road design phase.

Driveway	Movement	Design Speed (mph)	Recommended Stopping Sight Distance (ft)	Actual Sight Distance (ft)	Sight Distance OK?
Cameron Rd &	Right-turn		530'	>1,200'	Yes
SE Driveway	Left-turn	55	610'	>3,000'	Yes

Table 6 Intersection Sight Distance Analysis

7.3 AUXILLIARY LANE ANALYSIS

The auxiliary lane analysis considers whether acceleration and/or deceleration lanes (i.e. turn bays) should be built to serve a given driveway. The thresholds for recommending auxiliary lanes are given in Chapter 2 of the City of Pflugerville's engineering design manual and Table 2-3 of TxDOT's Access Management Manual; the results of the analysis are shown in **Table 7**. The volumes listed in the table are the greater of those generated during general park use and those generated during special events. Left turn lanes will be required for all median openings. To make a conservative analysis, it will be assumed here that both Cameron Road and Melber Road will have a posted speed limit greater than 45 mph.

Access Management July 7, 2017

Right Turn to or from Property (>45 mph)								
	Acceleration Lane (based on right-turn egress)	Deceleration Lane (based on right-turn ingress)	Acceleration Lane	Deceleration Lane				
TxDOT Requirement	>200 vph	Rec		Required?				
SE Driveway & Cameron Rd	30	71	No	Yes				
SW Driveway & Melber Rd	18	83	No	Yes				
Mid. Driveway & Melber Rd	42	0	No	No				
NW Driveway & Melber Rd	160	37	No	No				
NE Driveway & Melber Rd	29	106	No	Yes				

Table 7 TxDOT Auxiliary Lane Thresholds

In addition to the right-turn bays shown in **Table 7**, a right-turn bay will be required for the westbound approach of Cameron Road and Melber Road. All right turn bays shall be designed in accordance with City standards.

Because both Cameron Road and Melber Road are expected to be divided roadways, City standards will require left-turn bays for all median cuts. Based on the simulation modeling, the recommended storage bay lengths can be found in **Table 8**. Some of the storage bay lengths have been increased to allow for the storage of two charter busses that could be utilized to move festival patrons from the parking areas to the festival areas, or for high pedestrian activity which could hinder traffic along internal roadways.

Access Management July 7, 2017

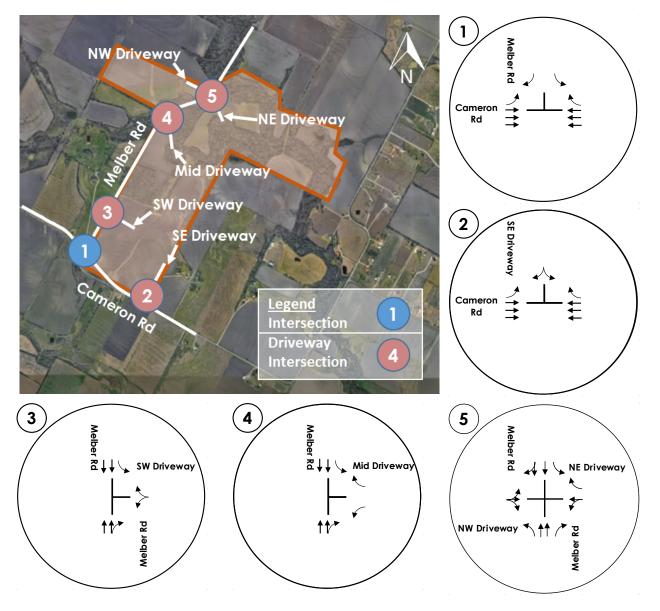

Table 8 Proposed Storage Lengths

Intersection	Approach	2030 Build Condition 95 th Percentile Queue (ft)	City Minimum Left Turn Storage Length (ft)	Proposed Storage Length (ft)
Cameron Rd & Melber Rd	EB-L	40	100	100

Access Management July 7, 2017

Figure 9 Proposed Lane Configurations (2030)

Conclusions July 7, 2017

8.0 CONCLUSIONS

The proposed 1849 Park site is expected to be a multi-purpose recreation facility, containing multiple sport facilities, playground areas, open park areas, and an amphitheater. The site is expected to be fully built-out by the year 2030.

With the improvements expected for Cameron Road, the construction of Melber Road, and the anticipated volumes generated by the site — both during normal park use and during special events — delay and queues would not be expected to require further improvements to any of the driveways, or the intersection of Cameron Road and Melber Road. Each of the driveways is expected to be able to operate with one lane entering and one lane exiting the site. However, it's suggested to build a left turn and right turn exit with storage lengths as shown in Table 8.

According to the sight distance analysis for Cameron Road and the southeast driveway, the existing sight distance is sufficient for the Phase 1 driveway. The existing vertical curve between the future intersection of Cameron Road and Melber Road could cause sight distance issues and should be evaluated during the design of Melber Road.

Per TxDOT standards, as described in the Access Management Manual, ingress right turn deceleration lanes are proposed for the following driveways:

- Westbound right turn for Cameron Road and Melber Road
- Westbound right turn for Cameron Road and the driveway on the southeast corner of the site
- Northbound right turn for Melber Road and the driveway near the southwest corner of the site
- Northbound right turn for Melber Road and the driveway accessing the northeast portion of the site

Per City standards, left turn bays will be required at all median cuts.

Throughout most of the site, two-lane undivided roadways would be sufficient to handle expected traffic. If the parking lots on the southern side of the site were to be occupied at near-capacity for festivals the roadways could become congested. A four-lane divided roadway could be considered from the driveway's intersection with Melber Road to the internal roadway's intersection with the driveway coming from the southeast corner of the site to relieve the potential traffic. Having a four-lane roadway in this area could also handle bus stops along the roadway as well as the median serving as a refuge area for high pedestrian traffic crossing the roadway.
